Title: >US-09-033-662-2 (1-221) from US09033662.pep

Description: Perfect Score:

Sequence: 1 MRRCRISGRPPAPPGVPAQA......CQGRGLELNPDTCRCRKLRR 221

Scoring table: TABLE unitprotable Gap 60

Searched: 74019 seqs, 26840295 residues

Post-processing: Minimum Match 0% Listing first 100 summaries

Database: swiss-prot35 1:swissprot

Statistics: Mean 3.428; Variance 0.401; scale 8.545

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is that of human vascular endothelial growth factor 3 (VEGF3). The growth factor can be used to stimulate angiogenesis and wound healing, and to promote vascular tissue repair. It can also be used to induce the growth of damaged bone, periodontium or ligament tissue VEGF3 antagonists can be used to inhibit tumour growth, or to treat diabetic retinopathy, inflammation, rheumatoid arthritis or psoriasis. VEGF3 is structurally related to the PDGF/VEGF family and it includes the conserved signature motif for the family (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO9639421-A1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human vascular endothelial growth factor (VEGF)-like polypeptide (W00725) is capable inducing the proliferation of vascular endothelial cells, of interacting with flt-l/fkl-1 receptors, and of inducing cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. It shows 33.3% identity with human VEGF (see also W00724). Splice variants (W00726-28) of SOM175 have also been identified. Recombinant SOM175 can be produced in host cells transformed with vectors carrying SOM175 CDNA (see also T33610). It is useful for inducing astroglial proliferation and for promoting neural survival and/or proliferation. Sequence 207 AA;
                                                                                                                                                                                                                                                                                                                                                                 06-SEP-1996;

                                                                                                                                                                                                                                                                                                                                     Claim 12; Page 42-43; 113pp; English. Splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also T33611-13) respectively lacking exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T33610). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with fit-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation. Sequence 188 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    6+7, and exon 4 of the SOM175 gene (see also T33610). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with flt-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation. Sequence 143 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular endothelial grow

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PT accelerate angiogenesis in wound healing, also related nucleic acid
PT and antibodies for cancer diagnosis
Claim 18; Page 59; 107pp; English.
CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)
CC W04824-W04831 represent the vascular endothelial or mesodermal cell
CC proliferation. VEGF is also a glycosylated cationic diner, and is
CC contributes referred to as vascular permeability factor (VPF). VEGF has
CC diverse effects, depending on the specific biological context in which it
CC is found. VEGF is a potent endothelial cell mitogen, and directly
CC contributes to induction of angiogenesis in vivo by promoting endothelial
CC tissue regeneration/reorganisation. The VEGF proteins of the invention
CC share the angiogenic and other properties of VEGF, but are distributed
CC and expressed in tissues differently to VEGF. The proteins can therefore
CC be used to accelerate angiogenesis in wound healing. Antibodies against
CC complementary to the coding sequences for the proteins. The antibodies can
CC complementary to the coding sequences for the proteins of the invention
CC can also be used for enabliting angiogenesis. The antibodies can
CC complementary to the coding sequences for the proteins of the invention
CC can also be used to detect VEGF-B coding sequences. Owantification of
CC weff-B in cancer biopsy specimens may be useful as an indicator of
CC metastatic risk. VEGF-B expression in a cell can be retarded using
CC especially useful in retarding VEGF expression in tumour cells.

GILLMOON S, HAYWARD NK,
Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis claim 18; Bage 53-54; 107pp; English.

W04824-W04831 represent the vascular endothelial growth factor (VEGE) proteins of the invention, which promote endothelial or mesodermal (C) proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGE has alverse effects, depending on the specific biological context in which is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor fragment #1.

They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with fit-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO9626736-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W04824;

tissue regeneration/reorganisation. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.

CLaim 18; Page 55-56; 107pp; English.

CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)

CC proteins of the invention, which promote endothelial or mesodermal cell

CC sometimes referred to as vascular permeability factor (VPF). VEGF has

CC diverse effects, depending on the specific biological context in which it

CC is found. VEGF is a potent endothelial cell mitogen, and directly

CC contributes to induction of anglogenesis in vivo by promoting endothelial

CC cell growth during normal embryonic development, wound healing, and

CC tissue regeneration/teorganisation. The VEGF proteins of the invention

CC share the anglogenic and other properties of VEGF, but are distributed

CC and expressed in tissues differently to VEGF but are distributed

CC and expressed in tissues differently to VEGF. The proteins can therefore

CC be used to accelerate anglogenesis in wound healing. Antibodies can loo be used diagnostically to quantitatively detect VEGF B. Primers

VRF167 (W00863) is the murine homologue of an alternatively spliced variant (W00726) of human vascular endothelial growth factor-like variant (W00726) of human vascular endothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglia proliferation and of promotting neural survival and/or proliferation. Its amino acid sequence was deduced from a CDNA clone (T13810) isolated from a new-born mouse barain cDNA library. VRF167 Shows 85% identity and 92% similarity to its human counterpart. It lacks 101 amino acids found in VRF186 (W00863), the murine homologue of SOM175, owing to a deletion of exon 6 during splicing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer; metastatic risk; tumour cell; mouse.

VRF186 (W00863) is the murine homologue of human vascular endothelial vrF186 (W00863) is the murine homologue of human vascular endothelial vrF186 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. Its amino acid sequence was deduced from a cDNA clone (T13809) isolated from a new-born mouse brain cDNA library. An alternatively spliced variant, VRF169 (W00864), was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells. CC VW04824-W04831 represent the vascular endothelial growth factor (VEGF)

CC W04824-W04831 represent the vascular endothelial or mesodermal cell

CC proliferation. VEGF is also a glycosylated cationic dimer, and is

CC growthimes referred to as vascular permeability factor (VPF). VEGF has

CC diverse effects, depending on the specific biological context in which it

CC is found. VEGF is a potent endothelial cell mitogen, and directly

CC contributes to induction of angiogenesis in vivo by promoting endothelial

CC tissue regeneration/reorganisation. The VEGF proteins of the invention

CC share the angiogenic and other properties of VEGF, but are distributed

CC and expressed in tissues differently to VEGF. The proteins can therefore

CC be used to accelerate angiogenesis in wound healing. Antibodies against

CC complementary to the coding sequences for the proteins can therefore

CC complementary to the coding sequences for the proteins of the invention

CC complementary to the coding sequences for the proteins of the invention

CC complementary to the coding sequences for the proteins of the invention

CC complementary to the coding sequences for the proteins of the invention

CC complementary to the coding sequences. Quantification of

CC VEGF B in cancer biopsy specimens may be useful as an indicator of

CC metastatic risk. VEGF-B expression in a cell can be retarded using

CC especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT

CC This sequence represents the N-terminal peptide of a vascular endothelial CC growth factor (VEGF) protein of the invention (see W04824-W04831). This completes the N-terminal peptide of a vascular endothelial CC growth factor (VEGF) protein of the invention (see W04824-W04831). This cc sequence was coupled to keyhole limpet heamocyanin, to produce antibodies against human VEGF-B. VEGF is a glycosylated cationic dimer, which CC promotes endothelial or mesodermal cell proliferation, and is sometimes cc effects, depending on the specific biological context in which it is contributes to induction of angiogenesis in vivo by promoting endothelial cc lell growth during normal embryonic development, wound healing, and ct tissue regeneration/reorganisation. The VEGF proteins of the invention cc and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies can also be used diagnostically to quantitatively detect VEGF-B. The antibodies can also be used to detect VEGF-B coding sequences. Opantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences for the proteins of the invention cc can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences or the proteins of the invention of vegF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences of the invention of coding sequences of the invention of vegF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences coding sequences, this is sequences and the vegF-B coding sequences of the invention of coding sequences and the vegF-B coding sequences of the invention of coding sequences and the vegF-B coding sequences of the invention of coding sequences and the vegF-B coding sequences of the invention of coding sequences.

Statistics: Mean 23.748; Variance 38.778; scale 0.612

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Thu Nov 26 00:01:31 1998; MasPar time 2.31 Seconds 151.826 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Sequence: Title: >US-09-033-662-2 (69-82) from US09033662.pep 1 PSCVTVQRCGGCCP 14

Scoring table: PAM 150 Gap 11

Searched: 69111 segs, 25083644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swiss1

Statistics: Mean 24.744; Variance 39.426; scale 0.628

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
